www.almadenminerals.com

Progress Report on the El Pulpo Project, Mexico

The El Pulpo property is located north-east of Mazatlan and covers an area of approximately 200 square kilometres. Almaden Minerals Ltd. (Almaden) has optioned this property to Ross River Minerals Ltd. (Ross River) who can earn a 60% interest by spending US\$3,000,000 and issuing 425,000 shares to Almaden. Almaden and Ross River have identified high grade porphyry related gold, silver and copper mineralisation over a surface area in excess of 12 square kilometres. The property hosts at least two copper-gold porphyry targets and three high grade gold vein targets. Ross River has provided the company with the following results in the form of a news release, an excerpt from which follows:

"Continued geological mapping and sampling of the La Langosta target have outlined a zone of potassic and phyllic alteration covering an area approximately 2.0 kilometres long by 1.5 kilometres wide. A larger propylitic alteration zone occurs outside the phyllic alteration envelope. The potassic core is characterized by secondary biotite and potassic feldspar veining. Outside this zone occurs a quartz-sericite-pyrite alteration (phyllic) envelope and then an outer propylitic altered zone characterized by pervasive chlorite, disseminated pyrite and calcite veinlets. The limits of the propylitic alteration have yet to be defined. These alteration zones remain open to the southwest.

From observations of limited outcrop, copper (chalcopyrite and copper oxides) and minor molybdenite mineralization appears to be concentrated within an area of approximately 1,500 metres by 750 metres. The earlier identified El Bagre target lies within the La Langosta porphyry system, within the potassic altered envelope and is characterized by

chalcopyrite, copper oxide and minor molybdenite mineralization as veinlets and disseminations.

Ross River is still defining the structural controls within this porphyry system. However, the topographic relief, from Rio Frailes to the ridges 750 metres southeast, exposes the mineralized system vertically over 200 metres. This extends from a potassic zone, with chalcopyrite mineralization, near Rio Frailes, in the north, to a topographically higher phyllic altered zone containing secondary iron and copper oxides to the southeast.

Preliminary analyses have been received for 24 samples, taken from the initial discovery area of 100 metres by 75 metres, include copper sulphides, mixed copper sulphides and oxides and leached oxide cap. The three sulphide samples have copper grades ranging from 0.79 per cent to 1.02 per cent copper, 89 parts per billion (ppb) to 3,063 ppb gold and 35,434 ppb to 72,717 ppb silver (Note: 1,000 ppb is equivalent to 1.0 g/t). There are nine samples of mixed sulphides and oxides of copper ranging from 0.35 per cent to 1.06 per cent copper. Silver values range from 3,658 ppb to 37,387 ppb silver, and gold values range from 37 ppb to 324 ppb gold. Twelve samples from the leached oxide cap, as would be expected, have lower copper values ranging from 91 ppm to 2,121 ppm copper, gold values ranging from 12 ppb to 1,038 ppb gold, and silver values ranging from 210 ppb to over the upper detection limit of 99,999 ppb silver. The company is awaiting additional follow-up assays and is very pleased by these preliminary results outlining a large porphyry target area with significant copper, silver and gold values. To date a total of 54 rock samples has been taken at La Langosta. Victor Jaramillo, P.Geo, is the qualified person supervising work in this area."

Ross River has informed Almaden that Acme Analytical Laboratories Ltd. in Vancouver carried out the analyses reported.

Almaden believes these results to be very encouraging and are representative of a large gold bearing intrusive hosted vein system. Almaden currently has ten active joint ventures covering 12 properties, including seven properties in which partners are spending to earn an interest in the project and a regional exploration program with partner BHP Billiton underway to explore for copper-gold deposits in Mexico.

ON BEHALF OF THE BOARD OF DIRECTORS

Geophysical Survey underway at the ATW Diamond Project, NWT, Canada

ATW Resources Ltd. (ATW) has contracted Aurora Geosciences of Yellowknife, NWT to commence a ground magnetics and electromagnetics geophysical survey on the company's MacKay Lake project in the Northwest Territories of Canada. The survey is focussed on a 20 kilometer long kimberlitic indicator mineral train in glacial till that has been the focus of work over the past several years by ATW. Past interpretation of indicator mineral chemistry of this train suggests that the source is a diamondiferous kimberlite. A seventy seven hole overburden drill program carried out earlier in 2003 outlined a 1 by 1 kilometer area where the kimberlitic source is interpreted to be located.

ATW has recently received new data on the indicator minerals recovered in the last phase of drilling. This was an abrasion study of 289 grains of peridotitic garnets from 24 samples and was carried out by Maja Kiridzija, M.Sc., from KIM Dynamics. Most importantly the study suggested that there may be more than one source to the indicator mineral train. The study also confirmed the proximal distance of the source kimberlites, suggesting that the sources may be located less than a few hundred meters from the samples sites. This interpretation was based on the well preserved kelyphitic rims and patches of kimberlitic material on the grain surfaces, unabraded resorption textures and sharp fractured edges on the examined peridotitic garnets.

The present geophysical program is focussed on the areas considered likely to be the source of the kimberlitic bodies. This data will be reviewed prior to planning a diamond drill program to test the areas for the source kimberlite bodies in 2004. Wojtek Jakubowski B.Sc., P.Geo. is the qualified person on the ATW project, under the definition of National Instrument 43-101.

The ATW project is located roughly equidistant between the Diavik and Snap Lake diamond deposits. Almaden Minerals Ltd. has a 40% interest in ATW Resources Ltd., which has a 75% interest in the ATW project. The remaining 25% interest in the property is held by Aber Diamond Corporation and SouthernEra Resources Limited., which hold a 15% and a 10% working interest respectively.

Drilling Intersects High-grade Gold at the Siwash Project, B.C.

Edgar Filing: ALMADEN MINERALS LTD - Form 6-K

In September and October 2003 a 30-hole, 6570-meter diamond drill program was carried out to test the continuity of mineralisation at the company's wholly owned **Siwash Gold Project**. The deposit is located roughly two kilometres (km) south of Highway 97C and 45 km southeast of Merritt in the Okanagan area of Southern British Columbia. The mine is known for its very high gold grades and in the 1990s 51,750 ounces of gold were produced from 18,400 tons of quartz vein ore extracted from the B vein system in open pit and underground operations. **The Siwash Project presently has an indicated resource of 87,700 oz (2,727,400 grams) gold in 61,300 tons and a probable reserve of 45,200 oz (1,405,700 grams) gold in 44,500 tons for a total of 142,000 ounces in 123,000 tons** as calculated in 2000. This resource is developed on the WD and B vein systems and includes the **Deep B shoot** on the B vein system which is located immediately below the existing mine workings and can be accessed by extending the existing decline approximately 600 metres (m). It contains an inferred resource of 35,600 oz Au in 12,200 tons grading 2.925 oz/t.

Preliminary results have been returned from the lab and a summary of drill intersections returning gold grades greater than 10 grams per tonne (0.29 ounces per ton) are listed below. True widths are calculated to a minimum width of 0.5 meters based on core to vein angles and weighted according to width and specific gravity.

Hole Number	Vein System	Sample Interval		Averaged Interval		True Width meters	Grades over Average True Width			
		From (m)	To (m)	From (m)	To (m)		Au (g/t)	Au (oz/t)	Ag (g/t)	Ag (oz/t)

Note:

g/t signifies grams per tonne ; oz/t signifies ounces per ton

Four vein systems have been identified and drilled in the Siwash area: the **B system** with a strike length of 900 m has been tested down dip to 320 m; the **WD zone** with a strike length of 650 m has been tested to 370 m down dip; the **GCW zone** with a strike length of 300 m has been tested to 130 m down dip and the **Bullion Creek (BC) zone** which has been tested with two holes to a depth of 75 m.

The 2003 program extended the known perimeter of the WD zone in 50-meter step-outs from the existing drill grid both along strike and down dip. Six fill-in holes were drilled between existing 50-meter fences at the end of the program to confirm continuity of the structure and grade. Except for one hole that intersected an andesite dyke at the projected WD zone location, all holes returned good vein intersections. A new resource estimate incorporating results from the 2002 and 2003 drill programs, and complying with National Instrument 43-101 requirements, will be calculated by Giroux Consultants Ltd..

In 2001 a **possible extension to the B and WD vein systems** was found by trenching roughly two km along strike to the east, on the other side of an area of overburden cover. Grab samples of the vein material taken at surface returned averaged analyses of 0.922 oz/ton (31.6 grams/tonne) gold and 3.04 oz/ton silver (104.4 grams/tonne). A 0.5 by 0.5 m panel sample of the same vein taken in the wall of the trench returned 0.635 oz/ton gold (21.8 grams/tonne) and 0.96 oz/ton (32.9 grams/tonne) silver. This discovery was extremely significant as it adds two kilometres of prospective, unexplored strike length to the high-grade vein system.

Knight Piesold Ltd. has been contracted to review options for tailings and mill sites in the Siwash area. Knight Piesold Ltd. is also carrying out dilution studies to determine pump rates and a time frame for dewatering the Siwash open pit and underground workings.

The qualified person and supervisor for the 2003 exploration drill program is Wojtek Jakubowski, P. Geo. All samples were analyzed at Acme Analytical Labs in Vancouver using wet geochemical, fire assay and metallics techniques. Duplicate and blank samples were included in the sample shipments sent to Acme and confirmed procedural quality. Check assays were carried out by ALS Chemex Labs in Vancouver.

ON BEHALF OF THE BOARD OF DIRECTORS
