Please read important risk disclosure information towards the end of this presentation.

Notes

Edgar Filing: Van Eck Merk Gold Trust - Form FWP

Indices and terms referred to in this presentation may include the following:

U.S. Dollar (DXY) Index and Inverse DXY: measures the value of the United States dollar relative to a static basket of currencies with Euro (EUR) 56.6% weight,

Japanese yen (JPY) 13.6%, Pound Sterling (GBP) 11.9%, Canadian dollar (CAD) 9.1%, Swiss franc (CHF) 3.6% and Swedish krona (SEK) 4.2% weight. The DXY is a

generally well-known measure of the value of the US dollar versus major foreign currencies, and as such makes a relevant reference point for directional

currency strategies. The inverse of the DXY is the value of the currency basket relative to the U.S. dollar, i.e. short dollar and long foreign currencies. Because the

Merk Hard Currency Fund is long foreign currencies (and therefore short dollar), using the inverse DXY allows for the logical comparison of performance relative

to the Fund.

Bloomberg Dollar (BBDXY) Index: tracks the performance of a basket of ten leading global currencies versus the U.S. dollar, weighted by the share of

international trade and FX liquidity.

Deutsche Bank Currency Returns (DBCR) Index: an equal-weighted blend of the most widely used investment strategies among active currency managers. It

captures long term systematic returns available in the world currency markets. As a non-directional index, the DBCR provides a useful comparison to absolute

return currency strategies like the Merk Absolute Return Currency Fund.

Bloomberg-JP Morgan Asian Currency (ADXY) Index: a trade and liquidity weighted index of a basket of Asian currencies, excluding the yen, compared to the

U.S. dollar. Because the Merk Asian Currency Fund invests in a basket of Asian currencies, using the ADXY allows for a logical comparison of performance relative

to the Fund.

JPMorgan 3-Month Global Cash Index: measures the performance of money market securities denominated in foreign currencies.

Citigroup 3-Month U.S. T-Bill Index: an index that tracks the performance of U.S. Treasury bills with a remaining maturity of three months.

S&P 500 Total Return Index (SPXT): a broad-based measurement of changes in stock market conditions based on the average performance of 500 widely held

Edgar Filing: Van Eck Merk Gold Trust - Form FWP

common stocks. Performance figures assume that all dividends are reinvested.

MSCI EAFE (Europe Australasia Far East) Index: a free float-adjusted market capitalization index that is designed to measure the equity market performance of

developed markets, excluding the US & Canada. As international equity investment returns are a combination of equity returns and currency returns, the MSCI

EAFE provides a useful comparison to a strategy including U.S. equities and currencies, like the Merk Currency Enhanced US Equity Fund.

MSCI EAFE US \$ Hedged Net Index: a currency hedged variant of the above, designed to represent the return without the currency exposure if the index.

MSCI Emerging Markets (EM) Index: a free float-adjusted market capitalization index that is designed to measure equity market performance of emerging

markets.

Barclays Capital Aggregate US Bond Index: is a broad-based benchmark that measures the investment grade, U.S. dollar-denominated, fixed-rate taxable bond

market, including Treasuries, government-related and corporate securities, MBS (agency fixed-rate and hybrid ARM pass-throughs), ABS, and CMBS.

FTSE NAREIT US All REITs Index: spans the commercial real estate space across the US economy. It provides exposure to all investment and property sectors.

DJ-UBS Commodity Total Return Index: a diversified benchmark for commodities' fully collateralized returns.

Barclays US TIPS Index: measures the performance of the US Treasury Inflation Protected Securities ("TIPS") market.

VIX Index: Chicago Board Options Exchange (CBOE) Volatility Index, which shows the market's expectation of 30-day volatility.

Alpha: measures risk-adjusted return. The excess return of the fund relative to the return of the benchmark is the fund's alpha.

Beta: measures systematic risk based on the covariance of the portfolio's return with the return of the overall market. By definition the market has a beta of 1.

Sharpe RaJo: measures the excess return per unit of risk in an investment asset or a trading strategy.

CorrelaJon: is a measure of how assets move in relation to each other. Low or negative correlation indicates returns are less likely to move in tandem. This may

smooth out overall returns of a portfolio, a potential diversification benefit.

Standard DeviaJon: a measure of volatility.

This material must be preceded or accompanied by the prospectus. Before invesIng you should carefully consider the Fund's

investment objecJves, risks, charges and expenses. This and other informaJon is in the prospectus, a copy of which is available

at www.merkgold.com/prospectus. Please read the prospectus carefully before you invest.

Investing involves risk, including possible loss of principal. The Trust is not an investment company registered under the

investment Company act of 1940 or a commodity pool for the purposes of the Commodity Exchange Act. Shares of the Trust are

not subject to the same regulatory requirements as mutual funds. Because shares of the Trust are intended to reflect the price of

the gold held in the Trust, the market price of the shares is subject to fluctuations similar to those affecting gold prices.

Additionally, shares of the Trust are bought and sold at market price, not at net asset value ("NAV"). Brokerage commissions will

reduce returns.

Commodities and commodity-index linked securities may be affected by changes in overall market movements and other factors

such as weather, disease, embargoes, or political and regulatory developments, as well as trading activity of speculators and

arbitrageurs in the underlying commodities.

Trust shares trade like stocks, are subject to investment risk and will fluctuate in market value. The value of Trust shares relates

directly to the value of the gold held by the Trust (less its expenses), and fluctuations in the price of gold could materially and

adversely affect an investment in the shares. The price received upon the sale of the shares, which trade at market price, may be

Edgar Filing: Van Eck Merk Gold Trust - Form FWP

more or less than the value of the gold represented by them. The Trust does not generate any income, and as the Trust regularly

issues shares to pay for the Sponsor's ongoing expenses, the amount of gold represented by each Share will decline over time.

Investing involves risk, and you could lose money on an investment in the Trust.

The request for redemption of shares for gold is subject to a number of risks including but not limited to the potential for the price

of gold to decline during the time between the submission of the request and delivery. Delivery may take considerable time

depending on your location.

For a more complete discussion of the risk factors relating to the trust, carefully read the prospectus. The sponsor of the Trust is

Merk Investments LLC (the "Sponsor"). Van Eck Global and Foreside Fund Services, LLC, provides marketing services to the Trust.

Fishing for Gold?

www.merkinvestments.com 8 2015 Merk Investments

Axel Merk:

“Gold may
perform well
if investors
don’t get a
positive real
rate return
on cash”

Financial Repression?

Holding cash yields negative real returns

Gold paying no interest a competitor?

www.merkinvestments.com 9 2015 Merk Investments

A Fed’s “promise”?

www.merkinvestments.com 10 2015 Merk Investments

A “promise” to be “behind the curve” ?

“The Commisee currently anticipates that, even ater
employment and inflation are near mandate-consistent
levels, economic conditions may, for some time, warrant
keeping the target federal funds rate below levels the
Commisee views as normal in the longer run.”

Since the spring of 2014, the Federal Reserve Open Market Commisee
(FOMC) has included the above paragraph in its Statement. We
interpret this to be a commitment by the Fed to be “behind the curve,”

meaning that rate hikes may not keep up with upticks in inflation,
potentially leading to lower real interest rates. Real interest rates are
interest rates net of inflation.

Fiscal Outlook

www.merkinvestments.com 18 2015 Merk Investments

According to Modern Portfolio Theory, what would have been the

Optimal Portfolio allocation to gold since 1971? (Aug 1971 – Feb 2014)

Historically, gold has mitigated risk and served to improve the riskreturn profile of a traditional portfolio.

Source: Bloomberg, Merk Investments. Optimal Porholio, as defined by Modern Porholio Theory, is a hypothetical example for illustrative purposes, and is not indicative

of an actual product. Past performance is no indication of future performance. Not investment advice.

Modern Porholio Theory: theory of finance that asempts to maximize porholio expected return for a given amount of porholio risk by optimizing the proportions of

various assets. Optimal Porholio, as defined by the Modern Porholio Theory, is the mix of investments that provides the highest risk-adjusted return.

Sharpe Ratio: a measure of the excess return per unit of risk in an investment asset or a trading strategy.

S&P 500 Index: a broad-based measurement of changes in stock market conditions based on the average performance of 500 widely held common stocks. Performance

figures assume that all dividends are reinvested.
